ASSIGNMENT - 03

- Title: XML, DTD & CSS / XSL

- Problem Statement : Design the XML document to store the information of the elements of any business organization & demonstrate the use of a) DTD
  B) XML Schema &
  display contentent in (eg. tabular) by using CSS/XML

- Outcomes :
  Students will be able to,
  1. Design static webpage using XML
  2. Apply DTD to XML pages.
  3. Apply CSS / XSLT to XML pages.

- Software & Hardware Requirements

Softwar : 1. OS ; Win 7/8/10/Ubuntu
2. Browser : Google Chrome/ Edge
3. Software : Sublime / Notepad.

- Theory

XML stands for Extensible Markup Language
It is nothing but the text based markup language which is derived from stanard Generalized Markup Language.

XML tags identify the data and are used to store & organize data, rather than

displaying how to display it like HTML tags, which are used to display the data XML is not goint to replace HTML in near future.

Characteristics of XML:

1. XML is extensible - allows you to create your own self-descriptive tags, or language that suits your applications.
2. XML carries the data does not present it, XML allows yout to store the data irrespective of how it will be presented.

- Technology / Tool

The XML document have an XML declaration but, is optional and it is written as -

<?. xml version = "1.0" encoding = "UTF8"?>

Each XML element need to be closed either with start or end elements:

<element> ..... </element>

XML document can have only one root element

XML attributes:

Using a name/value pair, an attribute specifies a single property of an element. An XML element can have one or more atributes.

- Design / Execution steps

1. Write the xML code in notepad and save with .xml extension.
2. Write the CSS in notepad & save with .css extension.
3. Import CSS file in XML page.
4. Open XML page in browser.

- Conclusion :

Hence, we have designed static web page using XML language and applied style to it using CSS.

ASSIGNMENT - 04

- Title : HTML, Java Script
- Problem Statement : Write a program to design registration form for students by using HTML CSS & JS and perform following validations: all fields are mandatory, phone number & emal address.
- Outcomes :

  Students will be able to,
  1. Design static webpage using HTML
  2. Apply JS to HTML pages for validation of data.
- Software & Hardware Requirements

  Software : Notepad, Any Browser
- Theory :

JavaScript is a programming language of HTML as well web. It is preferred for creating network - centric applications. It is integrated & complimentary with Java. As JavaScript is integrated with HTML it is very easy to implement.

Advantages :
1. Requires less server interaction
2. Immediate feedback to the visitors

3. Increased Interactivity
4. Richer interfaces.

Validation

When client enters all the necessary data and press the submit button form validation is done at server side if data is entered by a client is incorrect or missing the server needs to send all data back to the client and request for resubmission of form with correct information.

- Basic Validation
  - First of all the form must be checked to make sure all the mandatory fields are filled in. It would require just a loop through each field in form.

- Data Format Validation
  - Secondly, the data entered must be checked for correct for format & its value.

- Technology / Tool

JS can be implemented using JS statements that are placed within <script> tags.

Script tag takes two important attributes:

- Language - This attribute specifies what scripting language you are using. Typically its value will be javascript.

- Type - This attribute is what is now recommended to indicate the scripting language in use and its value should be set to "text/javascript".

- Design / Execution steps:

1. Write an HTML code and save with .html.
2. Write function for form validation of email id, and phone no & enclosed this function in script.
3. Call this function onclick event of submit button.
4. Open HTML page.

- Conclusion:

Hence we applied the javascript validation to the fields for the form.
